Your reproducibility checklist

Tick what your project already does. Then pick **one** thing to start with this week.

1. Structure

□ My raw data is never edited

□ Raw data, cleaned data, code and results are kept in separate places

□ My files have clear names (no `final_v2` or `copy of`)

□ I could re-make my results from the raw data

2. Documentation

□ There is a README that says what the project is and how to run it

□ My columns are explained in a data dictionary

□ My report is made from the data and code, so nothing is copied and pasted

3. Environments

□ I have written down which software and versions I used

□ My packages are recorded in a file

□ A colleague could run my project on a new computer

4. Sharing

□ My data is saved in an open format such as CSV

□ I know where I would share my data, and under which licence

□ Someone else could find, understand and reuse it

My first step this week
